

Solving Quadratic Equations by Factoring

Jonathan R. Bacolod

Quadratic Equation

A **quadratic equation** is an equation that can be written in the form

$$ax^2 + bx + c = 0, \quad a \neq 0$$

Step 1: Standard Form

To solve a quadratic equation by **factoring**, first write the equation in **standard form**.

$$ax^2 + bx + c = 0$$

Step 2: Factor

Factor the quadratic expression completely.

Step 3: Zero Product Property

Apply the **Zero Product Property**:

If $AB = 0$, then $A = 0$ or $B = 0$.

Step 4: Solve

Solve each resulting linear equation.

Step 5: Check

Always **check** each solution by substituting it into the original equation.

Using the GCF

Some quadratic equations require finding the **Greatest Common Factor (GCF)** before factoring.

Steps at a Glance

Step	What to Do
1	Write in standard form
2	Factor (check for GCF first)
3	Apply Zero Product Property
4	Solve each linear equation
5	Check each solution

Examples

Example 1: Trinomial Factoring

Solve

$$x^2 + 5x + 6 = 0$$

Factor:

$$(x + 2)(x + 3) = 0$$

$$x = -2 \quad \text{or} \quad x = -3$$

Example 2: Factoring Out the GCF

Solve

$$2x^2 + 8x = 0$$

Factor out the GCF:

$$2x(x + 4) = 0$$

$$x = 0 \quad \text{or} \quad x = -4$$

Example 3: Difference of Squares

Solve

$$x^2 - 9 = 0$$

Factor:

$$(x - 3)(x + 3) = 0$$

$$x = 3 \quad \text{or} \quad x = -3$$
